

COP 21 should ensure support from EU industry to combat global warming

Introduction with main messages

**by Annette Loske, President IFIEC Europe
Press Conference**

COP 21 - Paris - 2 December 2015

Combat against global warming is built on global level playing field

Combat global warming

Technological solutions

Innovation

Research and Development

Experience, knowledge, resources

Companies to be able to provide resources

Global level playing field in competitive environment

Combat against global warming is built on global level playing field

Combat global warming

Companies to be able to provide resources

Global level playing field in competitive environment

The right coalition and framework for success in combating global warming!

Non-level playing field for EU industry reduces:

- **chances in winning the global competition**

but it also reduces:

- **research and development**
- **innovation and**
- **investment in GHG reduction technologies**

With COP 21 we need

to level out competition rules

to improve our chances in combating global warming

The not-level playing field for EU industry is already reality

**Energy costs pushed up by state interventions
are the basis of not-level energy competitiveness
towards global competitors**

Energy intensive industry is the building block of EU industry as a whole.

**What we need is:
An integrated climate, energy and industry policy ...**

**...to achieve the goals
of combating global warming**

A non-integrated policy achieves the opposite:

- **not-level hurdles to EU industry**
- **relocation to other regions**
- **loss of innovative potential**
- **increase of global emissions**

**IFIEC Europe and IFIEC World request
an integrated approach in combating global warming**

Only then, we are enabled to deliver our support.

**Manufacturing industry support is
essential in combating global warming**
